

Display Framework For Replaceable Picture with a Sequence of Images

Abstract of the Disclosure

A display framework includes a base, a bottom frame, a side frame, a picture frame, and an operation system provided between the bottom frame and the bottom side of the picture frame. The operation system includes a motor and a transmission unit, wherein the motor provides rotational movement to a gearwheel assembly through a transmission unit, then initiates the movement of a control gearwheel, a first direction guiding gearwheel, a second direction guiding gearwheel, a bridging gearwheel, a motion actuating gearwheel, and a motion actuator which undergoes linear reciprocal movement.

5

10 The motion actuator provides the linear movement of the picture frame. It is easy to replace the picture of the display framework of the present invention and both the front and rear sides of the picture frames can be viewed.
